

ZK6 Midday Session Bet Sheet

2026-06-11 · generated pre-midday · **ALL-STATES BASIS** — operator bets every state for the session, so per-state targeting is dropped; the decision number is P(combo boxes anywhere in the ~35-draw midday window). Covers MIDDAY slate + ALLDAY slate evaluated for the midday window. Calibrated P(hit) from CALIB-01, **refit this morning 13:53 UTC on post-BUG-162 labels (gate: test Brier 0.03372 ≤ trivial 0.03492)**; allday picks scaled by 90-day midday-activity share. Footprints from histories, midday sessions, last 90 days.

0. The frame for all-states betting

- Under the corrected (post-BUG-162) baseline, **any singles set has ≈18–19% forward probability of boxing somewhere in a midday session** (~35 draws × ~6/1000). Observed 30d midday slate rate (73%) is consistent with this.
- Calibrated p_{hit} is therefore used for **within-board ranking and stake split only** — its absolute levels are calibrated to the top-30 pool, not on-slate picks (see caveats).
- 90-day midday frequency is descriptive (how often the set actually boxed midday, any state), not predictive — a tiebreaker, not an edge.

1. The 2 Standouts

#	Combo	Origin	Play	Straight	Calib (midday-scaled)	Mid boxes 90d (≈/session)	Session split M/E
1	298	allday #2	HOLD — live leg, day 2 of ride (through 6/12)	928	~6.6%	15 (16.7%)	15/15 even
2	632	midday #6	Box — the add, if adding a midday leg	263	3.1%	17 (18.9%)	17/16 even

- 298 is the only pick that leads on both lenses** — #2 calibrated for the midday window, #2 observed midday frequency, dead-even 15/15 session split (signal not evening-borrowed). Already placed; no new stake.
- 632 is the observed-frequency leader** and the only pick at the uniform singles baseline (18.9%/session); every other pick sits below it because the engine deliberately skews cold/overdue (which the 6/10 cohort test showed earns no reversion bonus). Calibration ranks it bottom-third — the two lenses disagree; for all-states session betting the frequency lens is the decision-shaped one. Last midday box 6/6.
- 923 (calibrated leader, 20.4% full-day / ~6.8% midday-scaled) moves to the evening column** — on an all-states basis its FL concentration is irrelevant, its observed midday frequency is mid-pack (11/90d ≈ 12.2%), and 22 of 33 recent draws are evening (it is evening #1 again tonight). If re-entering 923 after yesterday's close, tonight's evening session is its home; add a midday leg only when splitting the position.

2. Full Board — midday window, both slates (refit calibration)

Combo	Origin	Straight	Calib full-day	Calib midday-scaled	Mid boxes 90d (≈/session)	Split M/E
923	allday #5	923	20.4%	~6.8%	11 (12.2%)	11/22 eve-skewed
298	allday #2	928	13.2%	~6.6%	15 (16.7%)	15/15 even
869	midday #2	869	5.0%	5.0%	10 (11.1%)	10/17
769	midday #1	769	4.1%	4.1%	9 (10.0%)	9/14
482	midday #3	428	3.9%	3.9%	11 (12.2%)	11/21
513	midday #4	153	3.6%	3.6%	13 (14.4%)	13/15
632	midday #6	263	3.1%	3.1%	17 (18.9%)	17/16 even
370	midday #5	307	3.0%	3.0%	9 (10.0%)	9/18
637	allday #4	367	8.4%	~3.0%	10 (11.1%)	10/18
384	allday #1	384	3.1%	~1.4%	11 (12.2%)	11/14
532	allday #6	532	2.5%	~1.1%	15 (16.7%)	15/18
963	allday #3	963	2.3%	~0.8%	9 (10.0%)	9/16

- Native-midday alternate on signal: **869** (top native calibration; only 10 midday boxes/90d, stale since 5/25).

- **769** (midday #1) keeps the rank-1 inversion caveat — slate position 1 earns no premium.
- **963** remains a midday skip despite T1 tier evidence — near-floor calibration, 10%/session observed.
- 923 and 532 were both drawn somewhere yesterday; today is the last day prior-day winners can appear as picks — CONFIG-17 (shipped 12:55 UTC today) re-binds the cooldown from tomorrow's slates.

3. Midday Jurisdiction Leaderboard (30d, descriptive only under all-states betting)

Jurisdiction	Midday draws	Box hits	Box %
DE	30	4	13.3%
CA	30	4	13.3%
GA / CO / IL / VA / NM / ID	30 each	3 each	10.0%
TX	52	4	7.7%
MS / FL / NY	30 each	2 each	6.7%

4. Caveats

- CALIB-01 levels are calibrated to the top-30 pool (rank ≤ 30, no on-slate filter) — they under-state on-slate probability by design. Use for ranking/stake split; the real all-states per-session number for any singles pick is ≈18–19%.
- Midday-window scaling of allday picks (full-day p_hit × 90d midday share) is back-of-envelope; the model does not condition on session.
- 90d frequencies are descriptive; per-draw uniformity means they should not predict forward. Engine sits at the uniform baseline post-BUG-162 — this sheet is allocation logic across a chosen total, not a demonstrated edge.
- Refit validation: Q5 reliability pred 10.8% vs actual 11.1% (the 6/10 fit's top-bucket over-prediction has washed out).

Source: slate_snapshots, daily_intelligence, histories, app_config.pick_prob_calibration (Supabase, project hitmaster). Session analysis 2026-06-11; midday slate generated 11:50 UTC, engine v2.1; CALIB-01 refit 13:53 UTC; CONFIG-17 shipped 12:55 UTC (effective from 6/12 slates).
