

ZK6 Allday — Straight-Hit Cost & ROI

30-day window · 2026-07-09 → 2026-08-07 · allday scope only · straight hits only

INTERNAL / OPERATOR · strict join of snapshot picks × histories · stored hit flags not used (BUG-162) · generated 2026-08-08

The cost question. At \$0.25 per jurisdiction-draw, 6 allday picks against a board of 75–77 draws costs **\$112.50–\$115.50 per day**, not \$125. Sundays drop to 66–67 draws (TX / WV / PR dark) = \$99.00–\$100.50. Actual 30-day spend: **13,386 lines × \$0.25 = \$3,346.50** — an average of **\$111.55/day**. The \$125/day assumption overstates the stake by **\$403.50** and raises the break-even bar by 1.8 hits/month.

ACTUAL COST	STRAIGHT HITS	RETURNED	NET	ROI
\$3,346.50	22	\$4,950	+\$1,603.50	+47.9%
13,386 lines @ \$0.25	1 per 608 lines	22 × \$225	+\$53.45 / day	vs +32.0% at \$125/day

COST BASIS RECONCILIATION

BASIS	LINES	COST	BREAK-EVEN HITS	ACTUAL HITS	NET	ROI
Assumed \$125/day flat	15,000	\$3,750.00	16.67	22	+\$1,200.00	+32.0%
Actual board × \$0.25	13,386	\$3,346.50	14.87	22	+\$1,603.50	+47.9%

Per-line economics: \$0.25 staked returned \$0.3698 — a 147.9% return of stake for the month, against the book's structural 90%. Break-even is 1 hit per 900 lines; the window ran 1 per 608.5.

EQUITY CURVE — CUMULATIVE NET

Dots mark paying days; larger dots are multi-hit days. Lowest equity point **−\$117.00** (7/11). Largest peak-to-trough drawdown **−\$228.00** (7/27 \$810 → 7/29 \$582).

RISK PROFILE

Days paid	18 / 30 (60.0%)	Lowest equity	−\$117.00
Zero days	12	Max drawdown	−\$228.00
Single-hit days	15	Worst day	−\$115.50
Two-hit days	2	Best day	+\$561.00 (7/30)
Three-hit days	1 (7/30)	Days to first profit	4 (7/12)
Longest drought	2 days	Working bankroll	~\$500

WEEKLY ROLLUP

WEEK	LINES	COST	HITS	RETURNED	NET	ROI
Jul 09 – Jul 15	3,126	\$781.50	4	\$900.00	\$118.50	+15.2%
Jul 16 – Jul 22	3,126	\$781.50	5	\$1,125.00	\$343.50	+44.0%
Jul 23 – Jul 29	3,120	\$780.00	4	\$900.00	\$120.00	+15.4%
Jul 30 – Aug 05	3,114	\$778.50	7	\$1,575.00	\$796.50	+102.3%
Aug 06 – Aug 07 (2d)	900	\$225.00	2	\$450.00	\$225.00	+100.0%
30-day total	13,386	\$3,346.50	22	\$4,950.00	+\$1,603.50	+47.9%

No losing week. The spread (+15.2% to +102.3%) is the shape of a 4-to-7-hit-per-week process, not a trend.

WHERE THE 22 CAME FROM

Combo selection contributed nothing. Box hits landed at **85 on 13,386 lines = 6.35 per 1,000** against a uniform expectation of 6.00 (+0.5σ) — the same flat result every audit has produced. The entire surplus sits in the **ordering**: which of the six permutations gets played.

ORDERING PLAYED	STRAIGHTS (OF 85 BOX HITS)	CONVERSION	VS CHANCE
bestOrder (what the slate publishes)	22	25.9%	+2.3σ
Ascending control (sorted digits)	18	21.2%	+1.3σ
Reversed control	14	16.5%	-0.1σ
Chance (1 in 6)	14.2	16.67%	—

Break-even conversion at this box rate is **18.9%**. The whole profit/loss question for this line reduces to one number: does bestOrder convert above 18.9% of box hits? It did, at 25.9%. Note the ascending control also drifted to 21.2% — at n=85 the controls themselves swing ±2σ, so this is consistent with an ordering effect, not proof of one.

SESSION SPLIT — SAME BOARD, DIFFERENT PICKS

DRAW SESSION	LINES	COST	STRAIGHTS	PER 1,000	RETURNED	NET
Midday draws	5,796	\$1,449.00	11	1.898	\$2,475.00	+\$1,026.00
Evening draws	7,590	\$1,897.50	11	1.449	\$2,475.00	+\$577.50

The allday slate's midday exposure returned 11 hits on the same midday draws where the standalone **midday** slate returned 4 on 5,796 lines (-37.9% ROI). Identical board, different picks. That gap is 30 days of n=4 against n=11 — suggestive, not actionable.

Confidence bounds — read before sizing up

- **22 hits carries a 95% Poisson band of roughly 14 to 33.** On the actual \$3,346.50 cost that is an ROI range of **-5.9% to +121.9%**. The point estimate is +47.9%.
- Against break-even (14.87 hits) the window is **+1.8σ**. Against no-skill uniform (13.39 hits) it is +2.35σ. Neither clears the bar this codebase uses for shipping an accuracy claim.
- **Anchor:** the identical allday line over the prior 90 days ran 50 hits on 39,672 lines — \$11,250 returned against \$9,918 staked, **+13.4%**. At a flat \$125/day for those 90 days it was **exactly \$0.00**. The +47.9% is this month, not the run rate.
- Combo selection remains at baseline in every window ever measured. Nothing here reopens that.

READ

- **Actual cost is \$111.55/day, not \$125.** Budget \$3,350/month for the full 6-pick allday board, and re-derive it from the live draw count each month rather than assuming a flat rate — Sunday dark days alone move it \$13/day.
- The line is well-behaved operationally: 60% of days pay, no drought longer than 48 hours, max drawdown \$228, no losing week. A ~\$500 working bankroll covered the observed worst case.
- One month at +47.9% and the prior three months at +13.4% is the profile of a process sitting near break-even with real variance, not a demonstrated edge. Size it as a bounded-drawdown line with a stated stop, not as something to scale into.

- The one live mechanism worth continued measurement is ordering conversion (25.9% vs 18.9% break-even). It is the only claim in this system that has not been falsified — and it needs universe-level confirmation, not another selected-pick month.

Method: picks unnested from **slate_snapshots.top_k_straights_json** (mode=balanced, deleted_at null, scope=allday), straight comparison **bestOrder ?? combo** vs **histories.result_digits** on matching date_et across all sessions. Payout \$225 per hitting jurisdiction per unit (900:1 on \$0.25). Stored hit_straight / hit_box flags deliberately not used. Window 2026-07-09 to 2026-08-07 inclusive, 30 days, no exclusions.
