

ZK6 Midday Session Bet Sheet

2026-06-10 · generated pre-midday · covers MIDDAY slate + ALLDAY slate evaluated for the midday window

Methodology: calibrated P(hit) from CALIB-01 logistic model (refit 2026-06-10 01:30 UTC). Allday picks carry full-day probabilities; the midday-window estimate scales each by its 90-day midday-session activity share. Footprints from histories, midday sessions only, last 90 days. No budget assumed — suggested split is proportional; scale to any total.

1. Combined Bet Sheet (both slates, ranked for the midday window)

#	Combo	Slate origin	Play	Straight order	~Midday est.	Split %	Target states
1	923	allday #4 (also evening #1)	Box	923	~5.8%	30%	FL, CA
2	298	allday #1 (overdue)	Box (+opt. straight 928)	928	~5.6%	29%	DE, CA, NJ
3	496	midday #4 (also allday #6)	Box	496	4.7%	24%	TN, DE, KS
4	632	midday #6	Box	263	3.2%	17%	TX, CA, KY

- **298 is the purpose-built midday position** — the only pick on either slate with a dead-even 15/15 midday/evening split, so its signal is not evening-borrowed. Its midday states (DE, CA, NJ) align with the midday leaderboard leaders.
- **923 ranks #1 on raw numbers but is evening-skewed** (21 of 31 recent hits are evening; it is also the evening slate's rank 1). If the 923 position is played only once today, the evening session is its natural home — only add the midday leg when splitting the position.
- **496 is the best pick native to the midday slate** — top midday calibration (4.7%), cross-scope convergence with allday, and the board's strongest single-state concentration (TN: 5 midday hits in 90d).
- **632 is the volume play** — 17 midday-session hits in 90d (largest footprint on the board), TX-heavy, last midday appearance 6/6.
- Straights are lottery legs today; 928 is the only one with rank and an even session profile behind it. Skip the rest.

2. Midday Slate — Full Board

Calibrated probabilities are flat (3.1–4.7%) — no standout. The confirmed midday rank-1 inversion means slate position 1 deserves no premium: 769 has 9 scattered single-state hits and no midday appearance since 5/25.

Pos	Combo	Straight	P(hit)	Midday 90d	Top midday states	Notes
4	496	496	4.7%	13	TN:5, KS:2	convergence w/ allday; 14d engine hits 8 (board high)
2	739	739	4.5%	7	scattered, 1 each	weakest footprint
1	769	769	4.2%	9	scattered, 1 each	overdue tag; rank-1 inversion caveat
3	482	428	3.6%	11	PA:2, TN:2	
6	632	263	3.2%	17	TX:4, CA:3, KY:2, WI:2	largest footprint; last midday hit 6/6

5	370	307	3.1%	9	ON:3, CA:2	ON concentration not bettable
---	-----	-----	------	---	------------	-------------------------------

3. Allday Slate — Evaluated for the Midday Window

P(hit) below covers the full day (any session). Midday share = portion of the pick's 90d activity in midday sessions; the product approximates the midday-only window. The two leaders beat everything native to the midday slate.

Pos	Combo	Straight	P(hit) full day	Mid / Eve 90d	Mid share	~Midday est.	Top midday states
1	298	928	11.3%	15 / 15	50%	~5.6%	CA:2, DE:2, NJ:2
4	923	923	18.0%	10 / 21	32%	~5.8%	FL:2, scattered
5	637	367	7.6%	10 / 18	36%	~2.7%	TX:2
2	514	514	6.3%	10 / 16	38%	~2.4%	TX:2, MS:1
3	963	963	1.7%	9 / 16	36%	~0.6%	nine states, 1 each — pure scatter
6	694	694	1.4%	13 / 21	38%	~0.5%	TN:5, KS:2 — same set as midday 496; covered there

- **963 is a skip for midday** despite its T1 tier-table evidence — calibrated probability is near-floor and its midday footprint is pure scatter. The tier table is reading popularity, not predictiveness.
- **694 = {4,6,9} = midday slate's 496.** One position, not two — do not buy both.

4. Midday-Session Jurisdiction Leaderboard (30d, vs midday + allday slates)

Jurisdiction	Midday draws	Box hits	Box %
DE	30	4	13.3%
CA	30	4	13.3%
IL	30	3	10.0%
ID	30	3	10.0%
CO	30	3	10.0%
VA	30	3	10.0%
NM	30	3	10.0%
GA	30	3	10.0%
TX	52	5	9.6%
MS / WI / NY	30 each	2 each	6.7%

5. Caveats

- Calibration (CALIB-01) estimates the probability of ≥ 1 box match in the pick's full scope window; it does not condition on session. The midday-share scaling is a back-of-envelope split, not a calibrated per-session model.
- Per-state counts are 1–5 hits over 90 days — directional context for where to place, not load-bearing evidence.
- Top calibration bucket historically over-predicts (validation: 17.7% predicted vs 12.2% actual). Treat estimates as ceilings.
- Post-BUG-162 corrected baseline: pick-level performance sits at the uniform baseline. This sheet is allocation logic across a chosen total, not a demonstrated edge.

- Jurisdiction data cleaned today (DATA-02): legacy MSS/WC codes merged into MS/W.Canada; footprints reflect the unified states.
